(Node.js example) What else added to BE?

idea-case-backend demo doesn't have almost any of these
Siba case backend has almost all of these already

23.4.2024

Haaga-Helia

More added with e.g. Express middleware

- **Schema-based validation** of input data objects. (A bit like with the Joi library)

- **Centralized** and "automatic" **error-handling** / exception handling. Directing e.g. express-validator errors automatically to log, cutting the handling of that request automatically

- **Authentication and authorization**. Using some token based authorization framework, mostly Oauth/JWT based.

- **Role-based method-level authorization**. (You can run this following method/endpoint only if your user account has the role that is annotated or called in code before this method)

- Enabling/disabling, changing things between **development, production enviroments** etc. environments. E.g. logging, debug information. Settings. Test data. "Is the development mode on?"

- **Testing.** Manual testing first, then automatedng more and more. Robot framework typically used for automated test case suites.

- **TypeScript** and the type checks it provides

- Code **style checker** and **formatter**

- Some kind of REST **API documentation auto-generator**, like with Hapi
